Introduction

[Project context, initial problem statement, overall objectives, brief presentation of the intended final product, announcement of the outline.]

Part 1 – Functional Analysis

Rephrasing the requirements

[Take the initial (often vague) requirements and rephrase them into precise, actionable statements. Explain the assumptions made to resolve ambiguities.]

Original requirement (from the brief) : *[quote or paraphrase of the vague requirement]*

Rephrased version : *[your clear, actionable interpretation]*

Selected features

Priority features

[List of features essential for the application to function properly.]

TABLE 1 : Priority features (MVP)

Feature	Description	Target user	Priority
<i>[Name]</i>	<i>[Description]</i>	<i>[Customer / Admin / etc.]</i>	High

Features included if time allows

[“Stretch” features that will only be developed if the schedule allows before the November deadline.]

TABLE 2 : Stretch features

Feature	Description	Condition for implementation
<i>[Name]</i>	<i>[Description]</i>	<i>[e.g., if Sprint 3 finishes early]</i>

Features excluded

[Features considered and then dropped, with justification (out of scope, too complex, lack of time, etc.).]

TABLE 3 : Excluded features

Feature	Reason for exclusion
<i>[Name]</i>	<i>[Justification]</i>

Summary

[Short summary paragraph / transition to the technical part.]

Part 2 – Technical-Functional Layout

Benchmark of the Movie Information API

[Comparison of the available APIs (e.g., TMDB, OMDb, IMDb API, etc.) against objective criteria.]

TABLE 4 : Movie API benchmark

Criterion	API 1	API 2	API 3
Cost			
Rate limits			
Data richness			
Documentation			
Ease of integration			
Final choice			

[Justify the final choice in one short paragraph.]

Overall structure and integration with third-party services

[High-level presentation of the application and its interactions with external services : Movie API, payment system, accounting dashboard, etc. This is intentionally more functional/synthetic than the detailed architecture diagram in Part 3.]

Justification of technical choices

[Why these third-party services and not others? Choices imposed by the requirements vs. choices made freely by the team. Link to cost, time, and team skill constraints.]

Part 3 – Technical Design

Architecture diagram

[Detailed technical view : application layers, frameworks, hosting, communication between components.]

FIGURE 1 : Architecture diagram

[Comment on the diagram ([Figure 1](#)) : role of each layer, technologies used.]

Data model

[What information does the application need to store ? List the main entities and their attributes.]

TABLE 5 : Data model — main entities

Entity	Main attributes	Comment
<i>[User]</i>	id, name, email, ...	
<i>[Movie]</i>	id, title, genre, ...	
<i>[Transaction]</i>	id, amount, date, ...	

Class diagram

[Object-oriented structure of the application : classes, attributes, methods, relationships (inheritance, composition, association).]

[Briefly comment on the main classes and their relationships (**?@fig-class**).]

Use case diagram

[Interactions between actors (customer, administrator, external system) and the main features of the system.]

[Briefly describe each use case ([Figure 3](#)).]

Part 4 – Project Management Description

Organization of the team as a product and development team

[Presentation of the team : who plays which role on the “product” side (vision, prioritization) and on the “development” side (implementation).]

TABLE 6 : Team organization

Member	Product role	Development role
<i>[Name]</i>	<i>[e.g., Product Owner]</i>	<i>[e.g., Backend]</i>
<i>[Name]</i>		

Role assignment within the group

[Detail of each member’s responsibilities, optionally as a RACI table.]

FIGURE 2 : Data Model

FIGURE 3 : Use case diagram

TABLE 7 : Role assignment (RACI)

Task / Module	Responsible	Contributors	Approved by

Methodology

[Working methodology adopted : Agile/Scrum, sprints, communication tools (Slack, Discord...), task management tools (Trello, Notion, GitHub Projects...), meeting frequency, code management (Git workflow, code reviews).]

Projected schedule – Gantt chart

[Schedule of the project’s main milestones up to the November deadline.]

FIGURE 4 : Gantt chart

Challenges encountered and adjustments

[Optional : lessons learned on project management, unforeseen events, schedule or scope adjustments.]

Conclusion

[Assessment of the work carried out against the objectives set in the introduction, review of features actually delivered vs. planned, limitations of the project, possible future developments.]

Appendices

- *[Original requirements / brief]*
- *[Significant code excerpts]*
- *[Mockups / wireframes]*
